

Abstract of the Disclosure

A narrow rear view mirror is mounted on a ball and socket on a post at an angle to an adhesive base of the mirror. Mating protrusions and indents in the ball and socket lock the mirror in place at a desired angle. Adhering the mirror on an edge of a side mirror of a vehicle enables specific viewing of a driver's blind spot independently of the view of the existing side view mirror. Adhering the mirror to a frame of a computer monitor enables specific viewing of entryways behind the computer user.
